

# Radioavismanuskripter Small Handmade Example

bam

February 8, 2007

The example is located in `.../data/radioavismanuskripter/`. The example depends on the 'SB project' (`.../data/ingest2Test/sbProject/`). The 'SB project' example has been updated with a 'text object type' and a 'filetype UTF8' (see fig. 2). The SB project should be further expanded with all 'pre-defined' types, filetypes and rights.

The 'radioavismanuskripter project' is shown in figure 1. Not all relations are shown in the figure. All objects except the project object have an 'isPartOfProject' relation to the project object. All objects except the rights object have a 'hasRights' relation to the (collection specific) rights object. All objects except the manuscript object have an 'isObjectType' relation to a predefined type object in the SB project, and all file objects except the original text file object have an 'isFileType' relation to a predefined file-type in the SB project.

The manuscript type defines the date and time of the broadcast and the number of pages of the manuscript as compulsory metadata. The new relations defined are 'hasManuscriptText' (there should be at most one), 'hasManuscriptPage' (at least one; 40 in the example), 'hasNext' (at most one) and 'hasPrevious' (at most one). The two first relations should be followed by the index disseminator to 'assemble' the 'radioavismanuskript', whereas the last two should not.

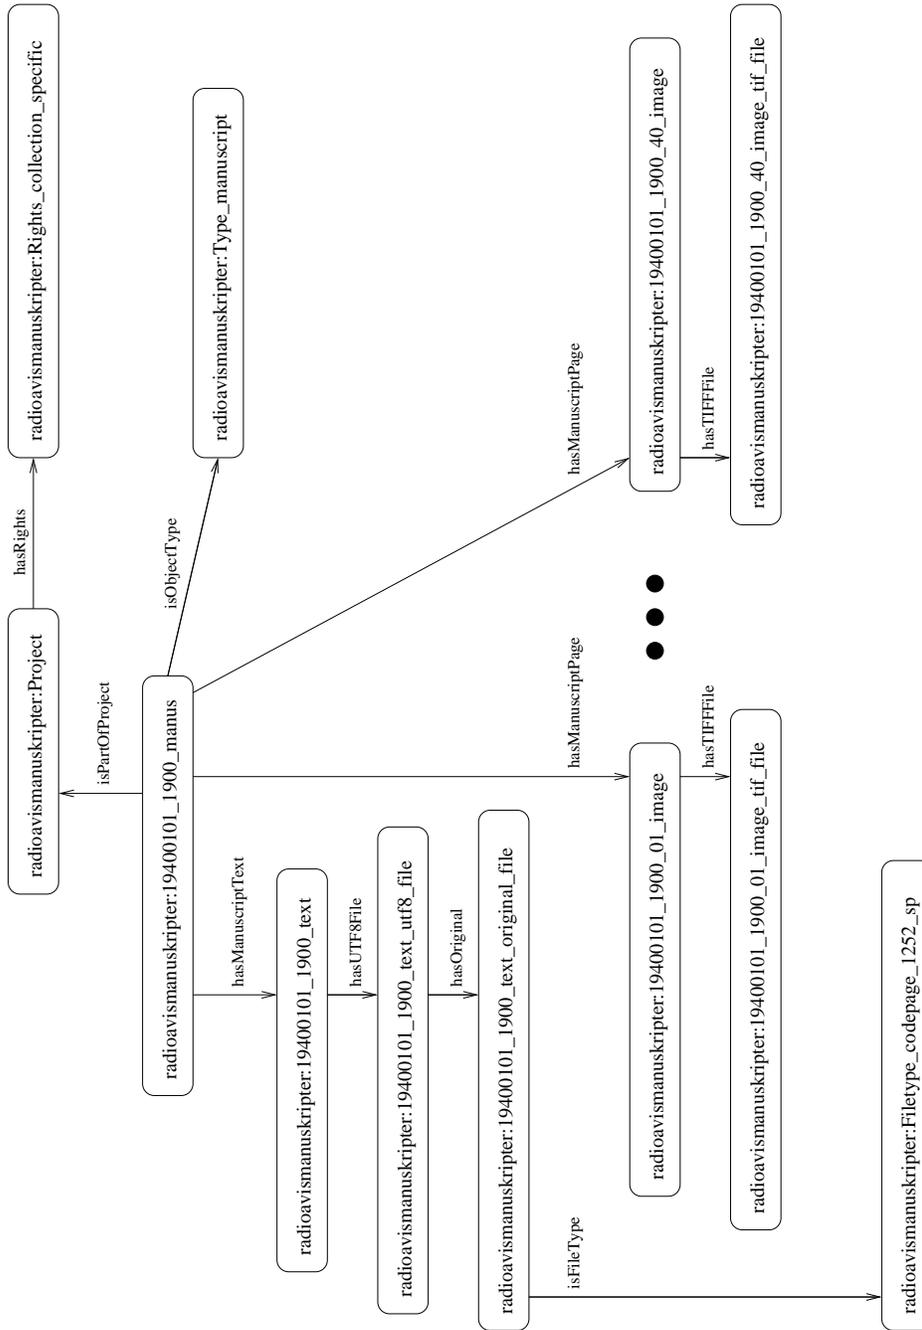

Figure 1: The 'radioavismanuskripter project'.

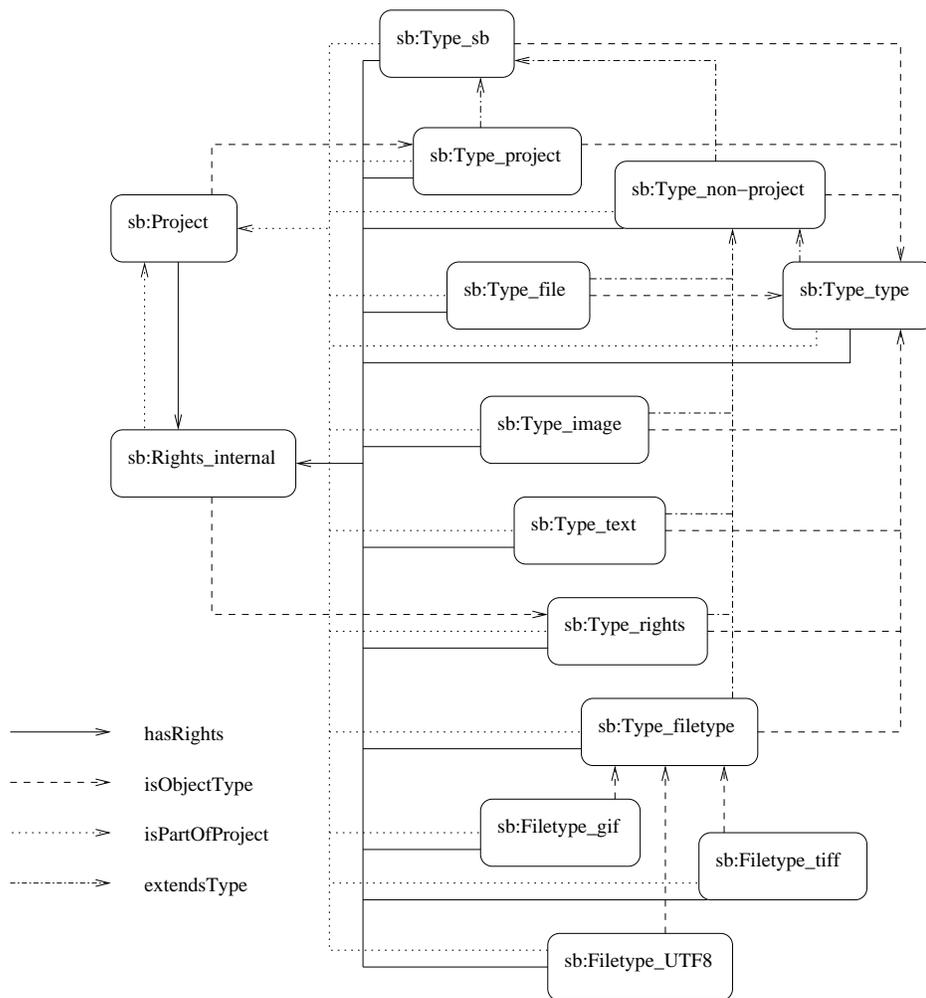

Figure 2: The 'SB project'.
